ISC CSSLP Dumps Available Here at:

<https://www.certification-questions.com/isc-exam/csslp-dumps.html>

Enrolling now you will get access to 343 questions in a unique set of CSSLP dumps

Question 1

You work as a Network Auditor for Net Perfect Inc. The company has a Windows-based network. While auditing the company's network, you are facing problems in searching the faults and other entities that belong to it. Which of the following risks may occur due to the existence of these problems?

Options:

- A. Residual risk
- B. Secondary risk
- C. Detection risk
- D. Inherent risk

Answer: C

Explanation:

Explanation: Detection risks are the risks that an auditor will not be able to find what they are looking to detect.

Hence, it becomes tedious to report negative results when material conditions (faults) actually exist. Detection

risk includes two types of risk: Sampling risk: This risk occurs when an auditor falsely accepts or erroneously

rejects an audit sample. Nonsampling risk: This risk occurs when an auditor fails to detect a condition because

of not applying the appropriate procedure or using procedures inconsistent with the audit objectives (detection

faults). Answer: A is incorrect. Residual risk is the risk or danger of an action or an event, a method or a (technical) process that, although being abreast with science, still conceives these dangers, even if all theoretically possible safety measures would be applied (scientifically conceivable measures). The formula to

calculate residual risk is (inherent risk) x (control risk) where inherent risk is (threats vulnerability). In the economic context, residual means "the quantity left over at the end of a process; a remainder". Answer: D

<https://www.certification-questions.com>

is incorrect. Inherent risk, in auditing, is the risk that the account or section being audited is materially misstated without considering internal controls due to error or fraud. The assessment of inherent risk depends on the professional judgment of the auditor, and it is done after assessing the business environment of the entity being audited. Answer: B is incorrect. A secondary risk is a risk that arises as a straight consequence of implementing a risk response. The secondary risk is an outcome of dealing with the original risk. Secondary risks are not as rigorous or important as primary risks, but can turn out to be so if not estimated and planned properly.

Question 2

The National Information Assurance Certification and Accreditation Process (NIACAP) is the minimum standard process for the certification and accreditation of computer and telecommunications systems that handle U.S. national security information. Which of the following participants are required in a NIACAP security assessment? Each correct answer represents a part of the solution. Choose all that apply.

Options:

- A. Certification agent
- B. Designated Approving Authority
- C. IS program manager
- D. Information Assurance Manager
- E. User representative

Answer: A, B, C, E

Explanation:

Explanation: The NIACAP roles are nearly the same as the DITSCAP roles. Four minimum participants (roles) are required to perform a NIACAP security assessment: IS program manager: The IS program manager is the primary authorization advocate. He is responsible for the Information Systems (IS) throughout the life cycle of the system development. Designated Approving Authority (DAA): The Designated Approving Authority (DAA), in the United States Department of Defense, is the official with the authority to formally assume responsibility for operating a system at an acceptable level of risk. Certification agent: The certification agent is also referred

to
as the certifier. He provides the technical expertise to conduct the certification throughout the system life cycle.

User representative: The user representative focuses on system availability, access, integrity, functionality, performance, and confidentiality in a Certification and Accreditation (C&A) process. Answer: D is incorrect. Information Assurance Manager (IAM) is one of the key participants in the DIACAP process.

Question 3

DRAG DROP

Drop the appropriate value to complete the formula.

Select and Place:

Single Loss Expectancy = Asset Value (\$) X Placeholder

Exposure Factor (EF)

Annualized Loss Expectancy (ALE)

Annualized Rate of Occurrence (ARO)

Options:

A.

Single Loss Expectancy = Asset Value (\$) X Exposure Factor (EF)

Annualized Loss Expectancy (ALE)

Annualized Rate of Occurrence (ARO)

Answer: A

Explanation:

Explanation: A Single Loss Expectancy (SLE) is the value in dollar (\$) that is assigned to a single event. The

SLE can be calculated by the following formula: $SLE = \text{Asset Value (\$)} \times \text{Exposure Factor (EF)}$ The Exposure

Factor (EF) represents the % of assets loss caused by a threat. The EF is required to calculate the Single Loss

Expectancy (SLE). The Annualized Loss Expectancy (ALE) can be calculated by multiplying the Single Loss

Expectancy (SLE) with the Annualized Rate of Occurrence (ARO). $\text{Annualized Loss Expectancy (ALE)} = \text{Single}$

Loss Expectancy (SLE) X Annualized Rate of Occurrence (ARO) Annualized Rate of Occurrence (ARO) is

a

number that represents the estimated frequency in which a threat is expected to occur. It is calculated based

upon the probability of the event occurring and the number of employees that could make that event occur.

Question 4

Which of the following penetration testing techniques automatically tests every phone line in an exchange and

tries to locate modems that are attached to the network?

Options:

- A. Demon dialing
- B. Sniffing
- C. Social engineering
- D. Dumpster diving

Answer: A

Explanation:

Explanation: The demon dialing technique automatically tests every phone line in an exchange and tries to locate modems that are attached to the network. Information about these modems can then be used to attempt

external unauthorized access. Answer: B is incorrect. In sniffing, a protocol analyzer is used to capture data packets that are later decoded to collect information such as passwords or infrastructure configurations.

Answer: D is incorrect. Dumpster diving technique is used for searching paper disposal areas for unshredded

or otherwise improperly disposed-of reports. Answer: C is incorrect. Social engineering is the most commonly

used technique of all, getting information (like passwords) just by asking for them.

Question 5

Which of the following roles is also known as the accreditor?

Options:

- A. Data owner
- B. Chief Risk Officer
- C. Chief Information Officer
- D. Designated Approving Authority

Answer: D

Explanation:

Explanation: Designated Approving Authority (DAA) is also known as the accreditor. Answer: A is incorrect. The data owner (information owner) is usually a member of management, in charge of a specific business unit, and is ultimately responsible for the protection and use of a specific subset of information. Answer: B is incorrect. A Chief Risk Officer (CRO) is also known as Chief Risk Management Officer (CRMO). The Chief Risk Officer or Chief Risk Management Officer of a corporation is the executive accountable for enabling the efficient and effective governance of significant risks, and related opportunities, to a business and its various segments. Risks are commonly categorized as strategic, reputational, operational, financial, or compliance-related. CRO's are accountable to the Executive Committee and The Board for enabling the business to balance risk and reward. In more complex organizations, they are generally responsible for coordinating the organization's Enterprise Risk Management (ERM) approach. Answer: C is incorrect. The Chief Information Officer (CIO), or Information Technology (IT) director, is a job title commonly given to the most senior executive in an enterprise responsible for the information technology and computer systems that support enterprise goals. The CIO plays the role of a leader and reports to the chief executive officer, chief operations officer, or chief financial officer. In military organizations, they report to the commanding officer.

Question 6

DoD 8500.2 establishes IA controls for information systems according to the Mission Assurance Categories (MAC) and confidentiality levels. Which of the following MAC levels requires high integrity and medium availability?

Options:

- A. MAC III
- B. MAC IV
- C. MAC I
- D. MAC II

Answer: D

Explanation:

Explanation: The various MAC levels are as follows: MAC I: It states that the systems have high availability and high integrity. MAC II: It states that the systems have high integrity and medium availability. MAC III: It

states

that the systems have basic integrity and availability.

Question 7

Microsoft software security expert Michael Howard defines some heuristics for determining code review in "A

Process for Performing Security Code Reviews". Which of the following heuristics increase the application's attack surface? Each correct answer represents a complete solution. Choose all that apply.

Options:

- A. Code written in C/C++/assembly language
- B. Code listening on a globally accessible network interface
- C. Code that changes frequently
- D. Anonymously accessible code
- E. Code that runs by default
- F. Code that runs in elevated context

Answer: B, D, E, F

Explanation:

Explanation: Microsoft software security expert Michael Howard defines the following heuristics for determining

code review in "A Process for Performing Security Code Reviews": Old code: Newer code provides better understanding of software security and has lesser number of vulnerabilities. Older code must be checked deeply. Code that runs by default: It must have high quality, and must be checked deeply than code that does

not execute by default. Code that runs by default increases the application's attack surface.

Code that runs in elevated context: It must have higher quality. Code that runs in elevated privileges must be

checked deeply and increases the application's attack surface. Anonymously accessible code: It must be checked deeply than code that only authorized users and administrators can access, and it increases the application's attack surface. Code listening on a globally accessible network interface: It must be checked deeply for security vulnerabilities and increases the application's attack surface. Code written in C/C++/assembly language: It is prone to security vulnerabilities, for example, buffer overruns. Code with a history of

security vulnerabilities: It includes additional vulnerabilities except concerted efforts that are required for removing them. Code that handles sensitive data: It must be checked deeply to ensure that data is protected

from unintentional disclosure. Complex code: It includes undiscovered errors because it is more difficult to analyze complex code manually and programmatically. Code that changes frequently: It has more security vulnerabilities than code that does not change frequently.

Question 8

What are the various activities performed in the planning phase of the Software Assurance Acquisition process? Each correct answer represents a complete solution. Choose all that apply.

Options:

- A. Develop software requirements.
- B. Implement change control procedures.
- C. Develop evaluation criteria and evaluation plan.
- D. Create acquisition strategy.

Answer: A, C, D

Explanation:

Explanation: The various activities performed in the planning phase of the Software Assurance Acquisition process are as follows: Determine software product or service requirements. Identify associated risks. Develop software requirements. Create acquisition strategy. Develop evaluation criteria and evaluation plan. Define development and use of SwA due diligence questionnaires. Answer: B is incorrect. This activity is performed in the monitoring and acceptance phase of the Software Assurance acquisition process.

Question 9

You work as a project manager for BlueWell Inc. You are working on a project and the management wants a rapid and cost-effective means for establishing priorities for planning risk responses in your project. Which risk management process can satisfy management's objective for your project?

Options:

- A. Qualitative risk analysis
- B. Historical information
- C. Rolling wave planning
- D. Quantitative analysis

Answer: A

Explanation:

Explanation: Qualitative risk analysis is the best answer as it is a fast and low-cost approach to analyze the risk impact and its effect. It can promote certain risks onto risk response planning. Qualitative Risk Analysis

uses

the likelihood and impact of the identified risks in a fast and cost-effective manner. Qualitative Risk Analysis establishes a basis for a focused quantitative analysis or Risk Response Plan by evaluating the precedence of

risks with a concern to impact on the project's scope, cost, schedule, and quality objectives. The qualitative risk

analysis is conducted at any point in a project life cycle. The primary goal of qualitative risk analysis is to determine proportion of effect and theoretical response. The inputs to the Qualitative Risk Analysis process are:

Organizational process assets Project Scope Statement Risk Management Plan Risk Register Answer: B is incorrect. Historical information can be helpful in the qualitative risk analysis, but it is not the best answer for the

question as historical information is not always available (consider new projects). Answer: D is incorrect.

Quantitative risk analysis is in-depth and often requires a schedule and budget for the analysis. Answer: C is

incorrect. Rolling wave planning is not a valid answer for risk analysis processes.

Question 10

Which of the following cryptographic system services ensures that information will not be disclosed to any unauthorized person on a local network?

Options:

- A. Authentication
- B. Integrity
- C. Non-repudiation
- D. Confidentiality

Answer: D

Explanation:

Explanation: The confidentiality service of a cryptographic system ensures that information will not be disclosed to any unauthorized person on a local network.
